

Creative Intelligence — Public Demo Provisioning Guide

What we need from you to launch the free demo at <https://creative-intelligence.duckdns.org>. Target cost: **\$0/month** (Oracle Always Free + DuckDNS + Let's Encrypt).

0. Checklist (everything we need)

#	Item	Where
1	Oracle Cloud tenancy + Always Free Ubuntu VM + its public IP	https://cloud.oracle.com
2	Firewall: TCP 22 (admin only), 80 + 443 (internet)	OCI security list
3	DuckDNS hostname <i>creative-intelligence</i> claimed + token (done: claimed, token pending)	https://www.duckdns.org
4	WorkOS redirect URL registered	https://dashboard.workos.com
5	Google OAuth redirect URL registered (only if Drive/Sheets sync wanted)	https://console.cloud.google.com
6	AI keys: at least one STT, one vision, one LLM provider	provider consoles (see 6)
7	Hand back: VM IP + SSH access + the secrets above	—

1. Oracle Cloud VM (free)

Sign up / sign in at <https://cloud.oracle.com> (free tier details: <https://www.oracle.com/cloud/free/>). Create one Always Free Ubuntu VM (Ampere ARM is fine) and note its **public IPv4 address** (Compute → Instances → instance → Public IP).

2. Network rules

In the VM's security list / NSG allow: TCP 22 from your admin IP only; TCP 80 and 443 from the internet (Let's Encrypt needs port 80). Never expose port 4321 — the app stays on loopback.

3. DuckDNS hostname (claimed)

creative-intelligence.duckdns.org is claimed. Keep the DuckDNS token secret — it goes into a root-only file on the VM, never email/Git. Renaming later only changes two values (DOMAIN, DUCKDNS_SUBDOMAIN); no code changes.

4. WorkOS — register the callback

In <https://dashboard.workos.com> add this exact redirect URL to the application:

<https://creative-intelligence.duckdns.org/api/auth/callback>

Then provide: admin email, plus the WorkOS client ID and API key for organization **org_01M255P1S4R6R5AH20AYNPM134**.

5. Google Cloud — register the callback

In <https://console.cloud.google.com> (APIs & Services → Credentials → your OAuth client) add this exact authorized redirect URI:

<https://creative-intelligence.duckdns.org/api/auth/google/callback>

Then provide: Google client ID + client secret. Skip entirely if Drive/Sheets sync is not wanted.

6. AI provider keys (at least one of each)

Capability	Providers	Key console
Speech-to-text	Deepgram, Groq Whisper	https://console.deepgram.com , https://console.groq.com
Vision	Gemini, OpenAI, Anthropic	https://aistudio.google.com , https://platform.openai.com , https://console.anthropic.com
Language	DeepSeek, OpenAI, Anthropic, Gemini	https://platform.deepseek.com (+ consoles above)

The demo **refuses to start** with mock AI — real keys are mandatory. Key values are never logged or displayed; a status page only ever reports *configured* / *missing*.

7. Hand back to us

Send back: (a) the VM public IP + key-based SSH access, (b) the DuckDNS token, (c) the secrets from §4–§6. We then run the one-command setup, enable HTTPS, and verify health, login, upload, analysis, and reports before announcing the URL.

Handling secrets: share keys through your company's password manager or vault — never plain email threads, chat, or screenshots. Tokens live in root-only files (*chmod 600*) on the VM.
